Instruction (abridged)
Input and output
Arbiter
gate
Decide whether the design team should review training now. Answer wait while the goal measures are still improving, and wake once they have levelled off or are moving away from the goal. A plateau is not excused as early learning or as adaptation to a new norm.
Input goal measures latest interval
Output wait wake
Reviewer
You are the Reviewer. Keep a concise memory of the assessment principles tried so far, diagnose how the active norm's assessments act, evaluate where training stands against the environment's goal, and decide whether to keep, revise or replace the norm. You give no design advice.
Input history summary course by norm latest interval
Output diagnosis verdict
Advisor
You are the Advisor. The active norm will be changed. For each requested candidate, advise what it should implement and why, grounded in the diagnosis and in what earlier norms and pilots showed. State principles only, without writing a norm, formula or constants.
Input diagnosis history summary trial memory
Output advice trial memory
Designer
You are the Designer. Implement the assigned task as a reputation norm that respects the assessment and sandbox contracts. State its principle as a self-contained intent and return exactly one assess function in JAX.
Input advice active norm environment sandbox rules
Output intent assess function
Arbiter
adoption
Choose the option whose measurements best meet the goal, the active norm included. Every option had the same adaptation and frozen-evaluation budget. Judge the measurements as they stand, without predicting future learning or choosing for exploration.
Input pilot evaluation difference from active
Output adopt keep
